# WHY COMPOST?

Adds nutrients

Saves money on fertilizers and mulch.

Improves soil's ability to retain water

Assists in balancing the soil's pH

Improves soil structure

Supports beneficial microorganisms

Before

After

Our compost was used on a field off of Wye Road to support vegetation growth. The picture on the right shows the field a few months after compost was applied. Compost socks were also used to prevent erosion.

Before

After

When the Sevierville Rain Garden was redone compost was added to the existing layers of soil. The garden no longer floods and the vegetation is thriving.
